

**Written description:**

My site is designed to give comprehensive details about myself and my curricula vitea and some description some my accomplished projects.

I try to break everything down into categories and keep it as simple as possible in order for the user to easily navigate my profiles. Since I'm anticipating that most users will be newbies with little to no computer experience, I have designed the elements to be large and included tooltips to instruct the user on how to navigate the website.

Since I plan on continuing to develop and update this site for public usage, I figured it would be a good idea to use the tools available to me i.e. html, css and javascript from scratch. I originally wanted to include use programming languages that I haven't learned yet.

My site is compliant with the W3 Validator as well as responsive (see comment.) I have added extra features which include: a contact form, tooltips, and lightbox.

I added a contact form for if users have any questions or comments. It is not active yet but I hope to learn the appropriate code to implement it in the future. I added tooltips for when the user hovers their cursor over a button. This will give them a little extra information as to the purpose of each button. Lastly, I added a lightbox plugin to expand pictures and make them more easy to view.
